Question 4 Tries remaining: 3

Marked out of 1.00 | Flag question

The list `10km_times` contains times, in minutes, taken by runners to run a 10km race. The `when [space] key_pressed` script below should calculate and display the average (mean) of the times in the list, or tell the user that the list is empty. So for example if `10km_times` has the contents shown in the watcher below then the message 'Average time in minutes is 52.6' should be displayed.

```
when space key pressed
set position to 1
set total to 0
repeat length of 10km_times
  change total by a
  change position by 1
if b > 0 then
  say join Average time in minutes is total / c for 2 secs
else
  say No times recorded for 2 secs
```

The program is incomplete at the points labelled a, b and c. Select the code (in textual form) that should be inserted at each of these points.

a =

b =

c =
